## CRYOGENIC PIPELINE CONFIGURATIONS AND METHODS

### Field of The Invention

Configurations and methods for pipelines in which subcooled materials (typically at least 5 below -200 °F) are transported.

### Background of The Invention

Current configurations and methods for cryogenic pipelines typically involve the use of low pressure or vacuum environments in an insulating space around a product pipeline to achieve the desired thermal performance characteristics. While low pressure or vacuum systems often 10 provide relatively good insulation, operation and maintenance of such systems tends to be energy consuming, and frequently becomes problematic where such pipelines are submerged on, or even below the sea bed.

Among other uses, cryogenic pipelines (and especially LNG pipelines) are increasingly used in configurations for offshore LNG loading and unloading terminals. However, various 15 difficulties are often encountered, and most typically associated with thermal expansion, compression, and/or structural stability. For example, Villatte describes a cryogenic pipeline in U.S. Pat. No. 6,145,547 in which the product pipeline is typically manufactured from INVAR™ (36% Nickel steel), which has very low expansion and contraction properties. While thermal stress in such pipelines is almost completely avoided, various disadvantages nevertheless remain. 20 For example, INVAR™ steel is relatively expensive, and therefore often cost-prohibitive. Moreover, generation and maintenance of the low pressure (e.g., 100 mbar) in the pipeline assembly requires considerable energy.

In other known configurations, as described in U.S. Pat. No. 6,568,431 to Marchal, buckle strength is improved by adding fluting to the pipelines. However, addition of flutings 25 along the length of the pipeline typically increases production cost, and typically complicates manufacture, handling, and/or maintenance.

Therefore, while various methods and configurations for cryogenic pipelines are known in the art, all or almost all of them suffer from several disadvantages. Therefore, there is still a need for improved configurations and methods for cryogenic pipelines.

**Detailed Description**

5 The inventors discovered that pipelines transporting material at sub-ambient temperature, and especially cryogenic material can be constructed in a manner such that the pipeline has both increased mechanical stability and desirable thermal insulation properties while maintaining a mechanically simple structure, which is relatively inexpensive to manufacture and install.

In one especially preferred aspect of the inventive subject matter, a plurality of bulkheads  
10 (non-metallic, hybrid, or metallic) and spacers are employed to create an annular space between a product pipeline and a outer pipeline, wherein the annular space is at least partially filled with a microporous or nanoporous insulating material. The bulkheads are preferably configured (and coupled to the inner and outer pipeline) such that the bulkheads transfer the contraction induced axial compression load on the inner cryogenic product pipeine(s) to the outer jacket pipeline. In  
15 most embodiments of such pipelines, the pressure in the annular space will be ambient pressure. Consequently, it should be appreciated that the so configured pipe(s)-in-pipe system functions as a strucual column, with thermal insulation maintained in the annular space in an ambient pressure environment, thereby eliminating the need for expensive alloys, vacuum generation/maintenance, or use of expansion bellows.

20 More particularly, in preferred aspects of the inventive subject matter, the bulkheads that connect the inner and outer pipelines at the ends of the pipeline balance compression forces with rigidity of the outer pipeline. In such configurations, contraction forces transferred to the external pipeline, which is thereby compressed. To prevent buckling, spacers (e.g., thermally isolating) are placed around the inner product pipeline that maintain a predetermined distance between the  
25 pipes, while further cryogenic foam (e.g., nanoporous or microporous foam) is placed around the remaining surface of the product pipeline. It should be especially appreciated that such pipeline configurations advantageously allow use of 9% nickel steel for the product pipeline to reduce cost of manufacture.

Further mechanical stability may be imparted by placing the pipe-in-pipe assembly in a restraining environment. For example, contemplated pipelines may be placed in a trench with select back-fill material installed over the pipeline. Therefore, in such configurations, the load on the bulkheads and outer pipeline is transferred into the surrounding soil. Similarly, the pipelines 5 can also be constrained above ground. For example, the pipeline may be placed on a foundation of sleepers that contain sliding or gimbaled supports.

While not limiting to the inventive subject matter, it is generally preferred that two bulkheads cooperate to seal the annular space between the bulkheads. In such configurations, it is typically preferred that the annular space is kept at ambient pressure. Particularly preferred 10 materials for an LNG product pipeline comprises 9% nickel steel, while the outer pipeline comprises carbon steel. The preferred thermal insulation comprises a high performance nano-porous aerogel product in blanket or bead form installed within the annular space. Such aerogels may be applied in any form, however, preferred forms include flexible sheets, or spray-coated materials. It should be further recognized that installation of pre-fabricated and assembled 15 pipelines can be done by numerous known manners, and especially include towed method of installation. Alternatively, the pipeline may also be installed by a surface barge. Thus, it should be appreciated that the invention improves the existing art in three areas: Reduction of pipeline cost, increased pipeline reliability, and reduction in maintenance requirements.

While contemplated cryogenic pipeline configuration and methods are preferably 20 employed for LNG offloading and offshore LNG terminals, numerous alternative uses are also considered suitable herein. For example, contemplated alternative uses include transfer lines for floating LNG production, storage, and offloading vessels, liquid hydrogen and oxygen fueling lines for aerospace or other applications, and all applications that need to transport cryogenic products through pipelines. Still further contemplated uses include LPG transport, or transport of 25 gases and liquids having a temperature below ambient temperature (e.g., liquefied carbon dioxide, LPG, liquid nitrogen, etc.). Exemplary configurations and additional modifications are provided in the following presentation materials, which form part of the disclosure.

## Insulated LNG Pipeline Configuration

### ◆ Configuration Concept

#### – Pipe-in-Pipe (or multiple pipes-in-pipe)

- Internal Pipe is used as a product transfer pipeline, which is a metallic pipe rated for LNG service
  - Examples of Internal Pipe for LNG Service
    - ASTM 333 Grade 8, 9% Nickel Steel
    - ASTM A312 Grade TP, 316L Stainless Steel
- External Pipe is used as a casing pipe, which is a metallic pipe rated for pipeline service
  - also used as a structural member to contain the internal pipe in a dry environment
  - And to be used to contain the expansion and contraction forces from the inner pipe by the use of bulkheads attaching the inner and outer pipelines
  - and to contain an insulating material in the annular space between the inner and outer pipe, which is maintained in an ambient pressure environment resulting from the sealed bulkheads.
- Examples of External Pipe for Casing Service are ASTM X-52 with external fusion bonded epoxy (FBE) corrosion coating and external concrete weight coating if required.

LNG Safety Pipeline Insulation

1

## Insulated LNG Pipeline Configuration

### ◆ Configuration Concept

#### – Insulation

- Insulation is installed in the annular space and between bulkheads.

➢ Nano-porous insulation may be in the form of flexible blankets like that manufactured by Aspen Aerogels, Inc. as their “Flexible Aerogel Blanket”. The insulation is wrapped around the inner pipe to form a complete seal of insulation in the annular space.

➢ Nano-porous insulation may be in the form of beads like that manufactured by Cabot Corporation, Inc. as their Nanogel™ insulation material. The insulation is installed in the annular space completely filling the void.

- Insulation is used to insulate the cryogenic product within the inner pipe to maintain its low cryogenic temperature.

## Insulated ING Pipeline Configuration

### ❖ Configuration Concept

#### — Bulkheads

- Used to isolate the annular space between the inner product pipe and the external casing pipe to provide an ambient pressure environment for thermal insulation
- Used to transfer the thermal expansion and contraction loads from the inner pipe to the outer pipe, such that the combined configuration acts as a structural member with the pipes being constrained by internal centralizer spacers, which position the inner product pipe within the outer casing pipe as an aide during installation and as an aide in transferring internal loads to the external pipe.
- And external soil filled trench, which aides in aligning the pipe-in-pipe configuration for load transfer to the surrounding soil
- Or by external pipeline supports which support the pipe when used above ground, and which align the pipeline to aide in transferring the pipeline loads to the soil.
- May be metallic or non-metallic composition, or a combination of both and designed to minimize thermal heat loss / intrusion by their configuration and design, and sufficiently strong to resist the load transfer between the inner and outer pipe.

**FLUOR**

3

## Insulated LNG Pipeline Configuration

### ◆ Configuration Concept

#### – Spacer / Centralizers

- Used to centralize and space the inner product pipe within the external casing pipe
- Used to assist in the transfer of the thermal expansion and contraction loads from the inner pipe to the outer pipe, such that the combined configuration acts as a structural member.
- May be metallic or non-metallic composition, or a combination of both and designed to minimize thermal heat loss / intrusion by their configuration and design, and sufficiently strong to resist the load transfer between the inner and outer pipe.
- Used also as an installation aide during fabrication to allow installation of the outer pipe over the inner insulated pipe.
- Used during operation of the cryogenic pipeline to ensure insulation is not crushed or damaged in service.

LNG Subsea Pipeline Inspection Project

7

## Insulated LNG Pipeline Configuration

### ◆ Configuration Concept

- Pipe-in-pipe configuration is sealed to provide an ambient atmosphere for the protection of the cryogenic insulation.
- Subsea Application
  - Pipeline may be installed in a trench to assist in transmitting frictional forces to the soil and for protection
  - Pipeline may be installed on the seabed and covered with natural material, matting or other man-made materials to assist in transferring frictional forces to the soil and for protection.
- Onshore Application
  - Pipeline may be installed in a trench or on a prepared bed with covering to assist in transmitting frictional forces to the soil and for protection.
  - Pipeline may be installed above ground on prepared pipe supports with restraints to assist in transmitting forces to the soil.

**FLUOR**

8

## Insulated LNG Pipeline Configuration

### ◆ Configuration Concept

- Pipe-in-pipe configuration may be instrumented with sensors (fiber-optic or electrical) to measure
  - Pressure in internal product pipe
  - Pressure in the insulated annular space
  - Temperature in internal product pipe
  - Temperature in the insulated annular space
  - Heat Flux in the insulated annular space
  - Displacement of internal pipe with respect to outer pipe
  - Slug detection of product in inner pipe

CONFIDENTIAL LNG Subsea Pipeline Inspection Project

Thus, specific embodiments and applications of cryogenic pipeline configurations and methods have been disclosed. It should be apparent, however, to those skilled in the art that many more modifications besides those already described are possible without departing from the inventive concepts herein. The inventive subject matter, therefore, is not to be restricted except in the spirit of the present disclosure. Moreover, in interpreting the specification, all terms should be interpreted in the broadest possible manner consistent with the context. In particular, the terms "comprises" and "comprising" should be interpreted as referring to elements, components, or steps in a non-exclusive manner, indicating that the referenced elements, components, or steps may be present, or utilized, or combined with other elements, components, or steps that are not expressly referenced.
